

# USG SHEETROCK® BRAND ULTRALIGHT PANELS FIRECODE® X

Sound transmission loss tests were conducted by an accredited laboratory for acoustical performance under laboratory conditions in accordance with ASTM E90 and ASTM E413. It is important to follow best practices for sound control design and installation in order to obtain optimal installed acoustical performance. A basic rule is that sound performance is compromised any place where air can pass. Best practices include but are not limited to:

- All perimeters not covered with joint compound and tape shall be sealed with USG Sheetrock® Brand Acoustical Sealant, including between the floor and the base of the wallboard.
- The number and size of penetrations in a partition should be minimized and all openings should be completely sealed.
- Electrical boxes installed on adjacent sides of a partition should not be back-to-back or in the same stud cavity. Any unused openings in boxes should be sealed.
- Solid wood or mineral core doors with gasketed frames can help the acoustical performance of the system.
- Use of lightweight steel framing instead of wood studs.
- Addition of fiberglass or mineral wool sound control insulation in the stud cavities.
- Use of resilient channels to structurally isolate the wallboard panels from the framing.

More specific information regarding sound control design and construction can be found in the *USG Gypsum Construction Handbook* and Gypsum Association publication, *Fire Resistance Design Manual* (GA-600).

## GENERAL ACOUSTIC PERFORMANCE GUIDELINES

While some differences in STC value may be seen in the comparison data for wall assemblies, the differences are minimal and likely due to standard variations<sup>1</sup> in laboratory testing. Additionally, it has been found that the human ear cannot detect variances in sound levels that are less than 3 dB, as shown in the following chart.

Change in Sound Level	Change in Apparent Loudness
1-2 dB	Indiscernible
3 dB	Just perceptible
5 dB	Clearly noticeable
10 dB	Twice as loud (or quiet)
20 dB	Four times as loud (or quiet)

**Note:**

1. Based on an inter-laboratory comparison, the reproducibility standard deviation for reference specimens tested per ASTM E90, *Standard Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Element*, was found to be 2 dB or less in the test frequency range.

## TESTED ASSEMBLIES 25-GAUGE STEEL STUDS

Product	UL Type Designation
USG Sheetrock® Brand UltraLight Panels Firecode® X	ULX
USG Sheetrock® Brand Firecode® X Panels (traditional)	SCX
