ULTIMATE LOAD CAPACITY FOR USG STRUCTURAL PANEL CONCRETE ROOF DECK

The following table represents the Ultimate Load Capacity of USG Structural Panel Concrete Roof Decks. The uniform load and uplift capacities in this table represent the attachment of the Concrete Roof Deck to the structural framing members – the values for a roofing system are obtained from the roofing system manufacturer’s testing and specific installation instructions.

For the most up-to-date load tables, see the Progressive Engineering Inc. report, PER-14076.

For technical questions, email usgstructural@usg.com. A qualified architect or engineer should review and approve calculations, framing and fastener spacing for all projects.

For SI: 1 inch = 25.4 mm, 1 psf = 47.88 Pa.
(1) Ultimate Load Values have no safety factor included.
(2) Two framing spans minimum per panel piece.
(4) Blocking at all joints perpendicular to framing to be a minimum of 16 gauge 3-5/8” (92 mm) wide track. For sheathing installation where a single span condition exists, additional track blocking is required perpendicular to the framing located midway between the edges of the panel.
